

This project's simulation
(flux scaled 10x above literal value, peak density 0.1175)

Note: this run uses a flux 10x stronger than the paper's Table 1 value translates to in this project's units. This is a deliberate sensitivity/illustration run, NOT a claim of matching the paper's literal parameters. Growth is visible (peak density rises from 0.05 to 0.12) but still modest -- see the companion 100x-scaled run for a more clearly developed pattern, and the literal-value PDF for the actual result at the paper's own stated flux.
